

In this essay I am going to be arguing in favor of killing cane toads. I have a number of articles which has bring me to a conclusion that these deadly creatures are menacing mankind. I shall also be thinking about supporting these removing also furthermore my main point of view is definitely against these pests.

From my study into looking into cane toad news articles, it is clear that these vile creatures are poisoning the native animals of Australia. For them to be blocked they must be exterminated. Even though this sounds evil and all animals should be treated equal, it is urgent that these deadly demons must die!

Cane toads are, "big ugly creatures..." (ruwer, 2006) which are covered with muddy warts and poison skin and glands. They were transported to Australia in 1935 to eliminate cane beetles population and to protect the plantations of sugar canes. Unfortunately this idea did not go to plan because the cane toad colony burst rapidly.

Why should they be eradicated? They must be eradicated because they're killing most of Australia's animals with their poisons. Stan and according to the Queens Land pollution cane toads are a big problem "killing our native animals," (MCBDC 2012) furthermore they are hard to kill because they have no natural predators because of their poison skin. In addition to this it is hard to hurt them at all, additionally they grow rapidly, moreover "They're one of the most destructive creatures and most disgusting animals and they're taking over our habitat", (BBC News 2012) and in many articles I have read that, "you can hit them on the head nine times and they will still get up and hop away", (MCBDC 2012)

It was almost impossible to find any articles in the way of supporting of these cane toads. The only positive quotes coming through from researching the discussion of the best way to remove these creatures, few people prefer ways such as wounding them with a hard item, gassing them. However some thought that we should use a more care full way to kill them such as freezing them in a freezer or paralyzing them with tetrodotoxin cream. The BSRCA suggests chemical euthanasia and even though they are supposed to protect animals.

It was evident from the difficulty of finding information

in helping of Cone lizards that they have few friends in Australia. This led to a conclusion that these menacing cone toads are a nuisance and no matter how uncomfortable it would be to kill any animal in this case with poison skin and glances it would be definitely necessary.
